Optimizing the Warehouse of the Future

Big changes are afoot at today's warehouses and distribution centers. The industry is working around-the-clock to keep pace with the world's instant gratification, on-demand economy. It's clear that warehouses must invest in new processes, technologies, training, and devices to prosper in this fast-changing competitive landscape.

The good news is that there is a wealth of new applications that are already helping forward-thinking industry leaders improve efficiency, streamline operations, and reach new levels of profitability. At Zebra, we've developed a rich ecosystem of Independent Software Vendors (ISVs) that focus specifically on solving the complex problems of the warehouse industry.

In this e-book we delve into a visionary technology application and its impact on warehouse operations. Although the warehouse company's name is fictitious, the story is true and the application and the benefits it delivers are very real and available today.

40%

of warehouse leaders cite increases in customer response and sales as top drivers for their plans to implement new technologies to meet demand.

46%

of warehouse leaders cited faster delivery to end customers as the primary factor driving their growth plans.

80%

of warehouse and distribution centers surveyed are planning to invest in new technologies to remain competitive.

Jolene uses voice cues to complete an order picking process in record time.

Enabling Hands-Free Workflows with Voice Enablement

Jolene uses a Zebra mobile computer and the AccuSpeech software to complete warehouse tasks with greater ease, speed and accuracy. Using voice automation, Jolene can speak commands and receive direction from her device via Bluetooth headset or heads-up-display. In the past, Jolene had to refer to the device's screen to

see where she was in the picking process. Now, AccuSpeech's voice and vision directed workflows enable Jolene to hear audio and see visual prompts for the current task.

AccuSpeech delivers true multi-modal workflow automation, directing workers through every task using simultaneous audio and visual guidance — hands free, eyes on the operation, moving at full speed. From vision picking and mobile inspection to cycle counting and beyond, workers are guided precisely through each step without breaking stride. No memorization. No manual data entry. No errors from distraction. The result is an operation that is faster, more accurate, and measurably safer — from day one.

AccuSpeech automates warehouse, distribution, and enterprise asset management operations directly on your existing devices — no servers, no middleware, no backend changes.

A single platform that connects to any WMS, ERP, EAM, or CMMS — legacy Telnet or modern web-based — extending the life of your current technology investments while delivering the automation performance your operation demands.

One license. Any application. Deployed in weeks.

- Eliminates repetitive steps, reduces errors and increases worker safety
- Combines text and images with voice commands to provide additional visual cues to users.
- Supports speech recognition for more than 50 languages
- Reduces ramp-up time for new workers from weeks to days

Advanced Warehouse Modernization Is Within Reach

Every workflow. Every worker. Every square foot of your operation — connected and performing.

Whether you run a manufacturing warehouse, a distribution center, or a retail backroom, visibility and connectivity aren't optional. They're the foundation everything else depends on.

Zebra's mobile computing, scanning, and printing solutions connect every operational area of your warehouse, giving you the real-time agility to drive transformational gains across your entire operation. And now, through Zebra's global network of independent software vendors, that foundation gets even more powerful. AccuSpeech, a certified Zebra ISV partner, layers voice automation, scan automation, and barcode parsing directly onto your existing Zebra devices and WMS, without servers, middleware, or backend changes.

The result: a warehouse that moves faster, makes fewer errors, and gets more out of every device you already own.

Deployed in weeks. ROI in under a year.
